Vanessa

07/09/2021

Defining the Question

We will work as data scientists for a Kenyan entrepreneur who runs an online cytography course and would like for us to help her identify which individuals are most likely to click on her ads.

Metric for Success

We will perform bivariate and univariate analysis and successfully identify the individuals that are most likely to click on the ads

Experimental Design

1.Defining the Question 2.Data Cleaning 3.Exploratory Data Analysis 4.Implementing the plan 4.Conclusion and Recommendation

Data Preparation

Reading the Data

cor(df$Age,df$Clicked.on.Ad, method = c("pearson", "kendall", "spearman"))
```

```
## [1] 0.4925313
```

Moderate positive relationship: Some points are close to the line but other points are far from it, which indicates only a moderate linear relationship between the variables.

```

Large negative relationship: The points fall close to the line, which indicates that there is a strong negative relationship between the variables. The relationship is negative because, as one variable increases, the other variable decreases.

#Interpretation of the KNN MODEL MODEL K=1 which is a better model compared to k=3, from the confusion matrix calculation, we found out that: 27 out of 40 observations in the test data corresponding to did not click on ad are correctly predicted as did not click on ad 39 out of 55 observations in the test data corresponding to did click on ad are correctly predicted as did click on ad. #Interpretation of the Logistic model The p-value: $< 2.2e-1$ is generally small hence the model fits fairly well. # Conclusion and Recommendation The age of an individual was the top feature in determining clicking on an advert followed by Daily Internet Usage of which the maximum time spent online was 267 minutes. 45 years is the age that Clicked on the adverts the most, followed by 31 year individuals. Female individuals clicked on ads more than men.
